Candidates are grouped first by manual vLRR localisation (Yes / Partially / No). Columns are ordered left-to-right by visual and benchmarking usefulness: AF3 NLR-effector contact-pair evidence, max contact probability, iLIS, ipSAE, and multi-model interface consistency. All values are medians of 5 AF3 models. The supplied rank column is preserved from ranking_for_R.csv and is not recalculated here. All displayed interaction metrics are NLR x effector; ATP and intra-chain blocks are excluded. Triangle = repeated/severe custom steric-clash flag; orange circle = low effector pLDDT (<50). Positive controls are shown in red as references.
